

HOW TO CLEAN STEPSTONE PRODUCTS

All Stepstone precast products should be cleaned on a regular basis as part of an established maintenance regimen.

We recommend using a mild laundry powder, an OXI-type cleaner containing sodium percarbonate.

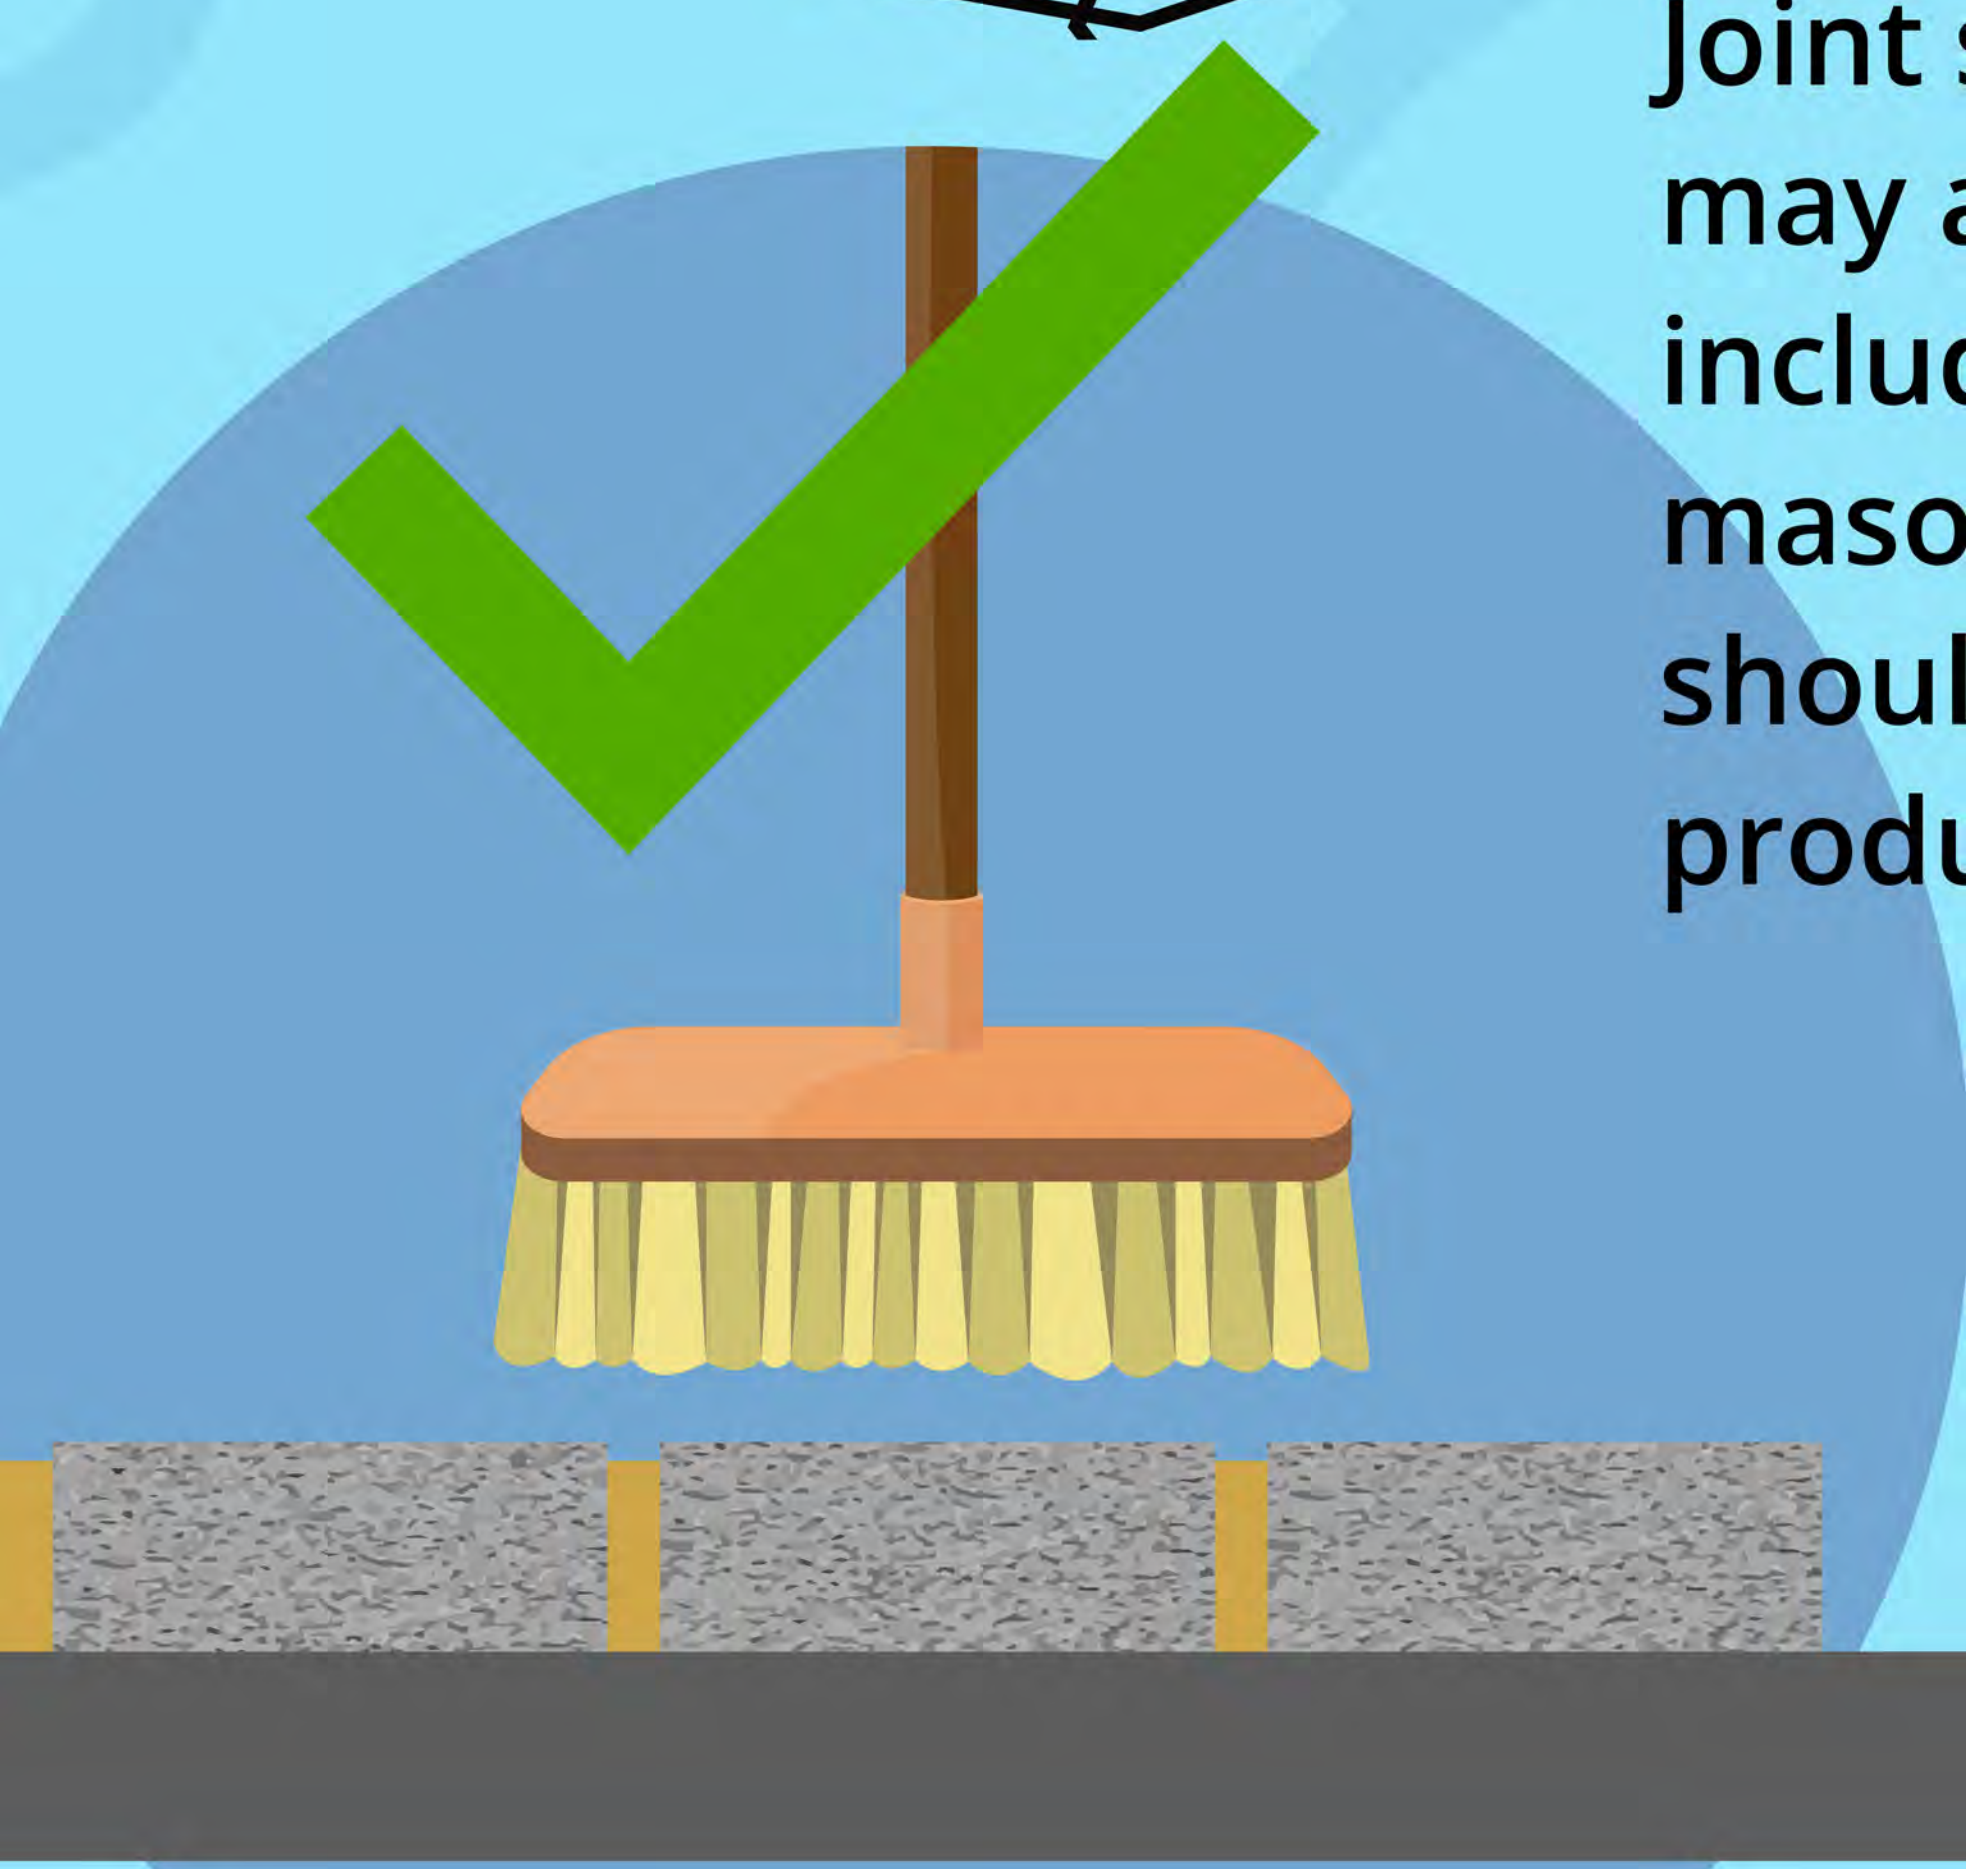

If a more aggressive cleaning is needed a standard masonry cleaner can be used.

Pressure washing Stepstone products are not recommended.

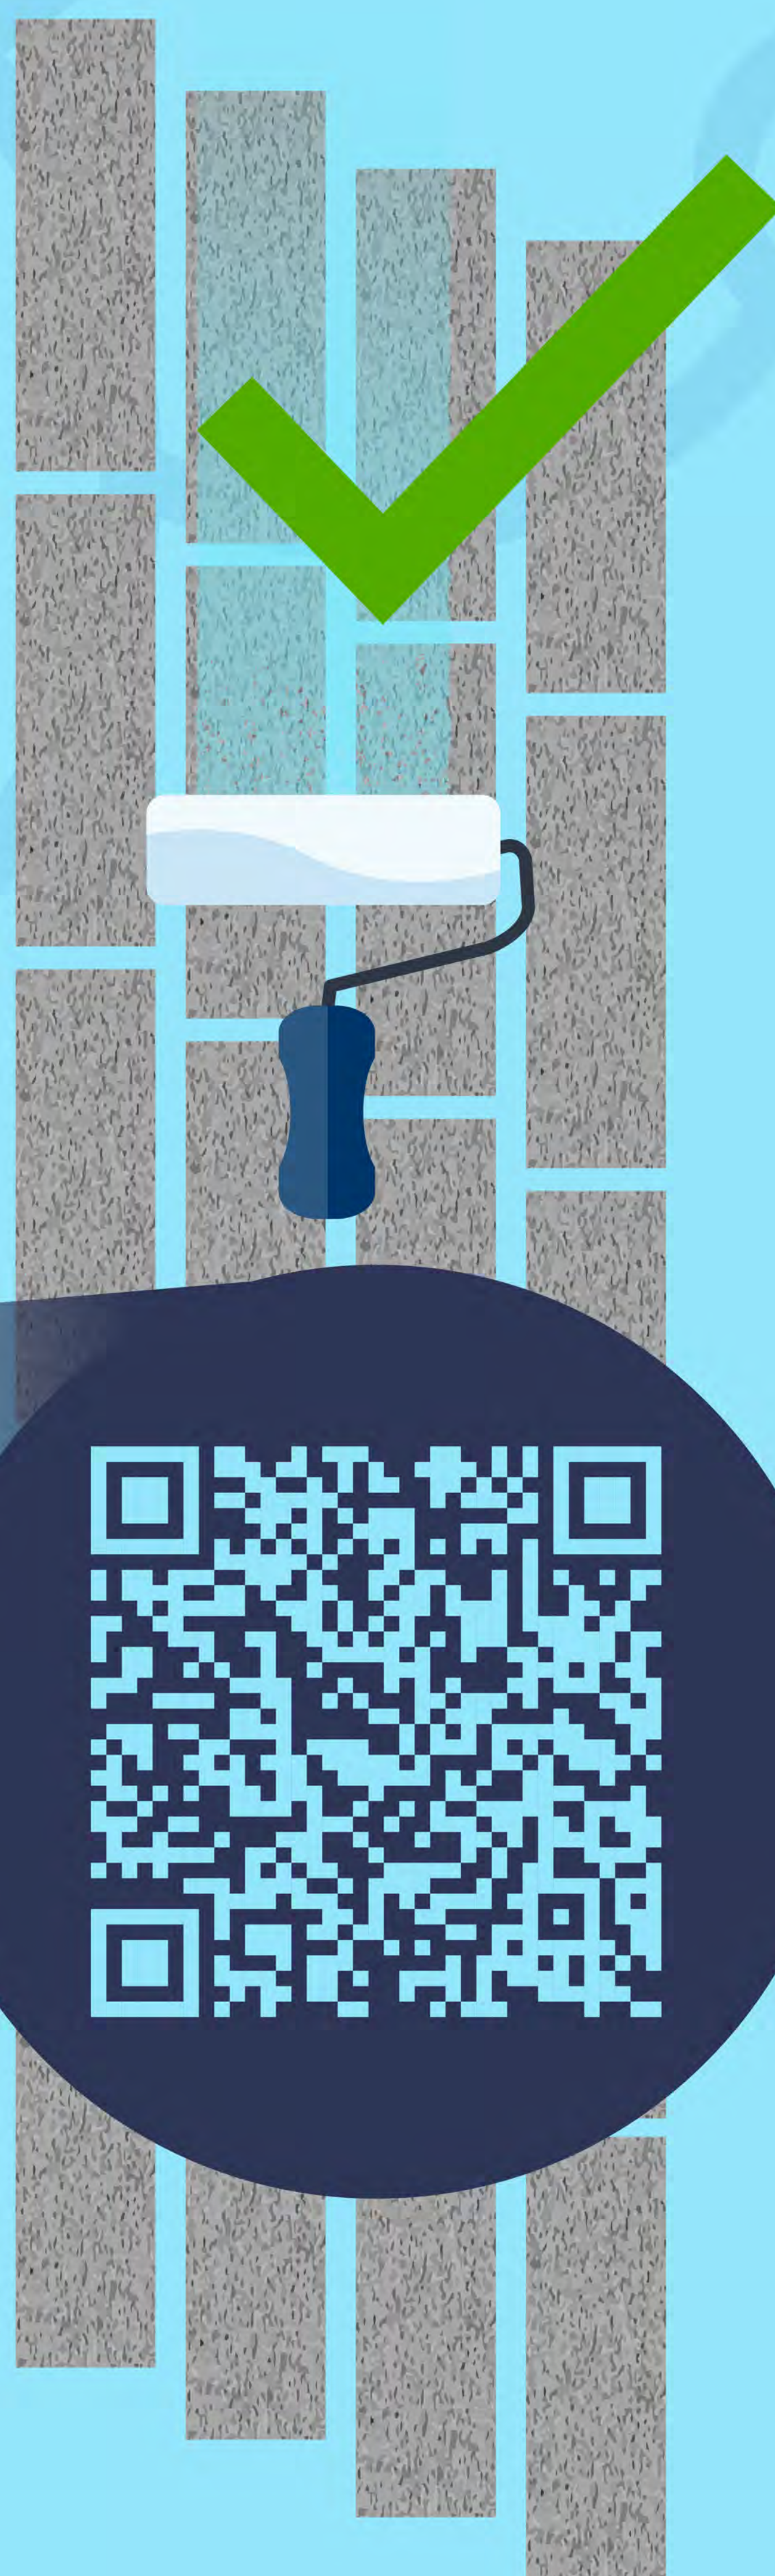

Paver joints may need maintenance, too

Joint sand in paver installations may also require maintenance, including refilling. Your local masonry distributing center should be able to suggest products for use in your area.

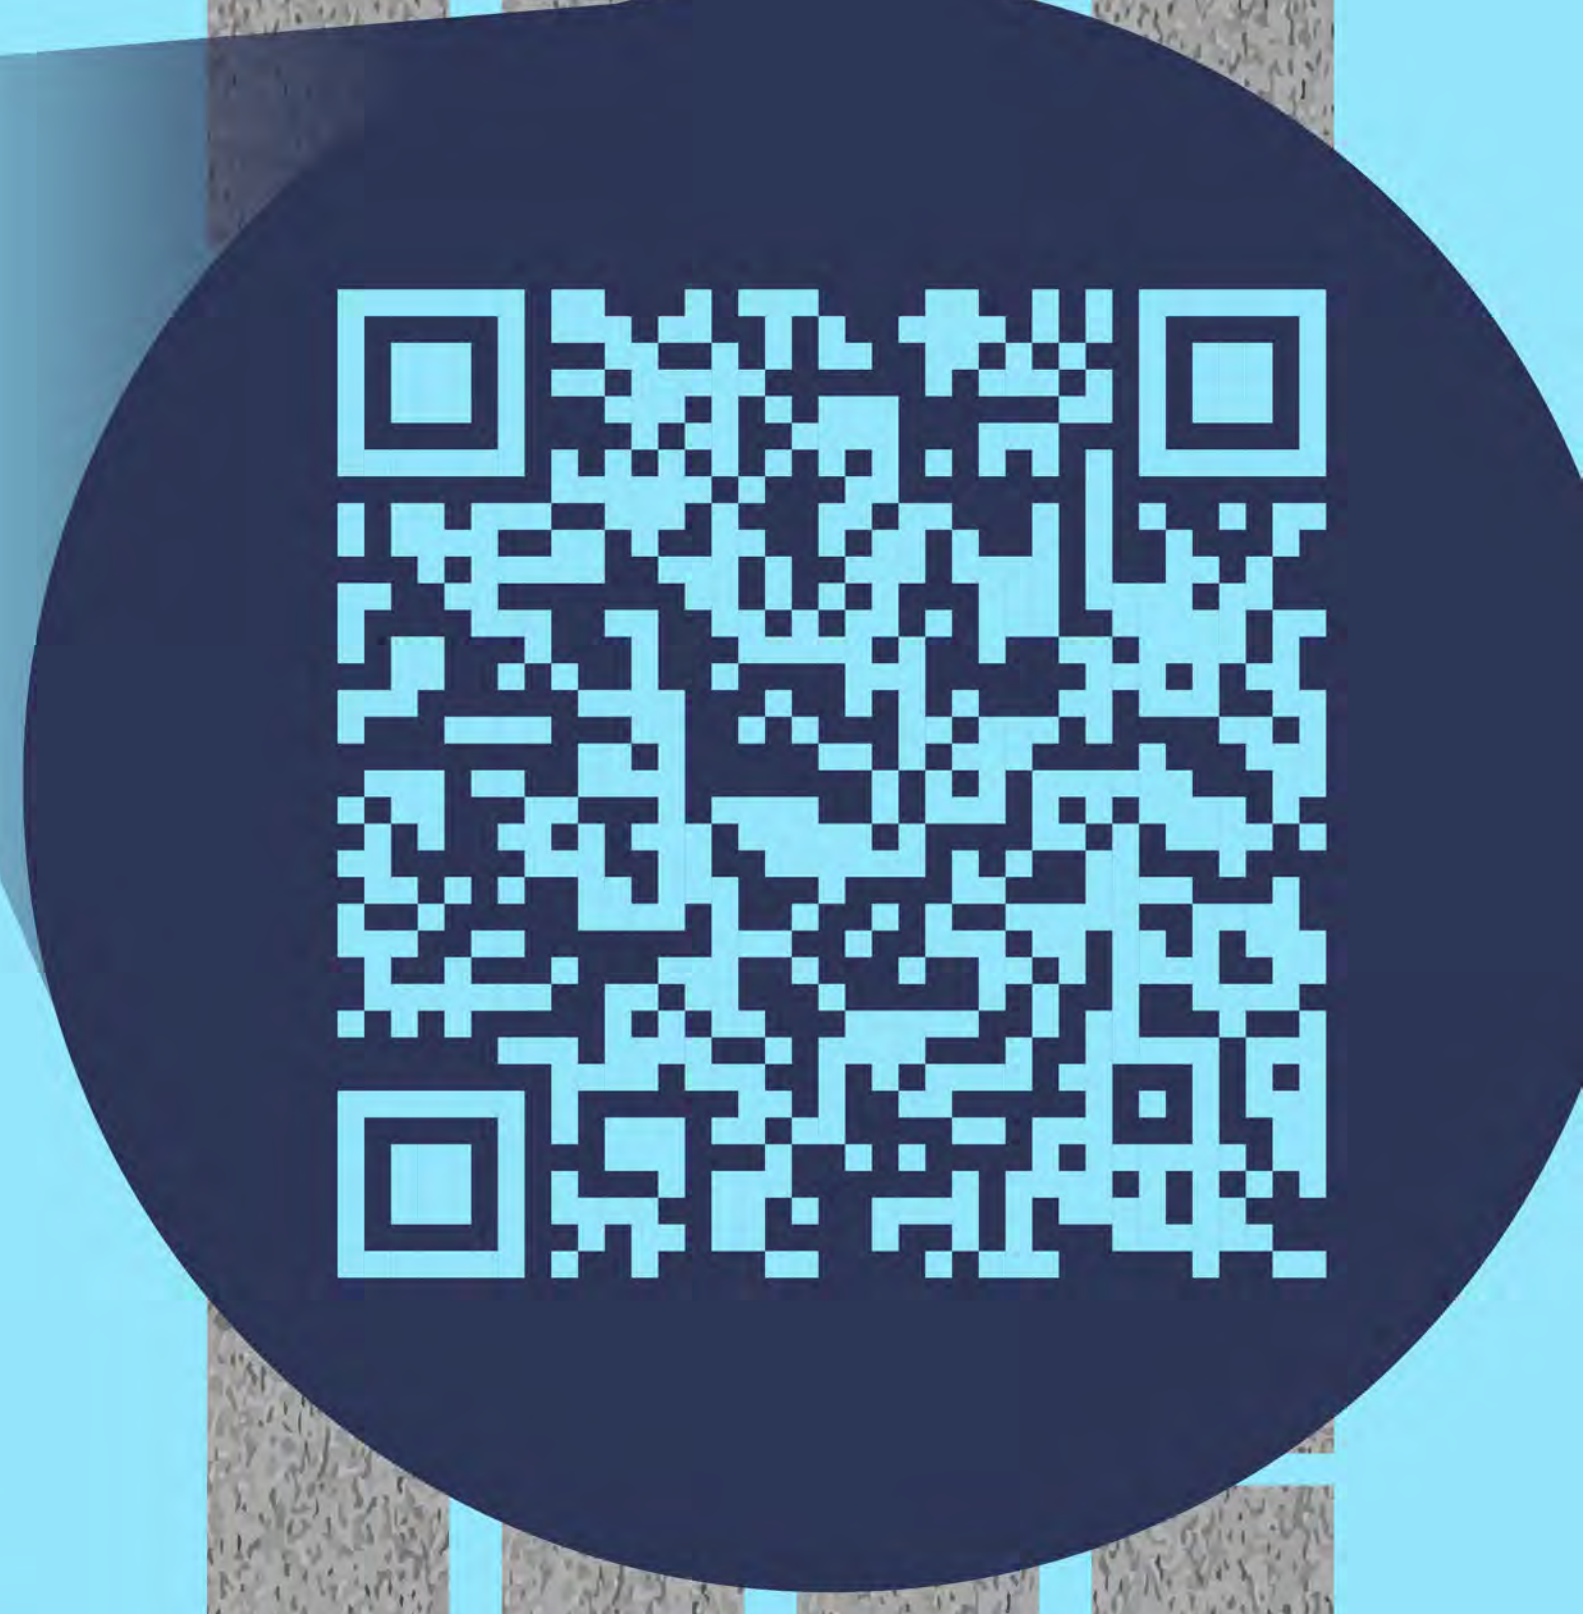

Sealing can help protect your precast concrete between cleanings

To help minimize any future discoloration you may want to seal the product.

Scan the QR code to learn more about sealing your Stepstone products.

Stepstone always recommends:

- Checking compatibility of all cleaners and sealers with precast concrete
- Following the manufacturer's use and application directions
- Testing products for desired results

Call us and we'll send you up to a dozen 3" x 3" samples of your original material. Or, send us a picture and we should be able to match it from there.
